

**Spatial Social Science
Workflow-Based Practices Series II**

The Workbench for Spatial Data Science

Presenter: Hanchen Yu, CGA, Harvard University
Chair: Wendy Guan, CGA, Harvard University

Spatial Data Lab
CGA @ Harvard University
GCSS@Wuhan University

Background: What is the WSDS?

- Workbench is the place where you will be building your workflows. Workbench is a collection of workflows?
- WSDS integrates a large number of spatial analysis workflows. It contains a large number of nodes for building a spatial analysis workflow.
- We will build workflows which use the most commonly used and the latest methods and add them to the workbench.
- After the release, we will establish a user group to update and feedback on the workbench in time.
- Workbench can serve different types of research. You could build your own workflow by using the nodes in the workbench or you could directly use the workbench to run all possible models and analyses.

Background: Why WSDS?

❑ Demands

- Repetitive data analysis
- Replicable data analysis
- Customized data analysis
- High efficient data analysis
- Data analysis for everyone without professional skill

❑ Challenges

- Most tools offer interactive and step by step data analysis with low efficiency
- Most tools offer fixed functions for data analysis or limited space for expanded functions
- Most data analysis (procedure and code) are difficult to replicate
- Most data analysis need professional skills while data analysis become more and more complicated

❑ Solutions (Combinable, replicable, expandable, suitable for users of any background)

- Tools with assemblable functions for data analysis
- Tools with replicable process
- Tools with expandable functions
- Tools with easy operation for everyone

Objectives

This project aims to build a workbench for spatial data science based on workflow tools

The objectives are to provide:

1. Easy, efficient and customizable toolkit for spatial data analysis with new added nodes
2. Workflow based case studies for research in spatial social sciences
3. Integration of data, methodology and applications for spatial data science
4. Training base for users with no skills in GIS and advanced methodology

Tasks

- ❑ Workbench development
 - Data access
 - Data processing and integration
 - Data analysis
 - Exploratory data analysis
 - Data modeling
 - Data visualization
 - Data applications
- ❑ New node development
- ❑ Research applications
 - Case studies
 - Publications
- ❑ Teaching applications
 - Curriculum
 - Teaching case studies
- ❑ Publications
 - User Guides
 - Journal papers and Books

The Workbench for Spatial Statistics built on KNIME

1 data input 2 basemap input 3 visualization

4 EDA

5 ESDA

6 OLS, MGWR, spatial regression, spatial filtering

Plans

1. Research data collection
2. Workflow & node development
3. Case development
4. Curriculum development
5. User Guide

Plans 1. Research data collection

- Data collections on Harvard Dataverse
- Research data
- Base maps(Global, China, US).

Plan 2. Workflow & node development

Data Access

- Dataverse
- GitHub
- CGE
-

EDA

- Descriptive reports
- Box plot
- Histogram
- Multi-vari chart
- Run chart
- Pareto chart
- Scatter plot
- Stem-and-leaf plot
- Parallel coordinates
- Odds ratio
- Multidimensional scaling
- Targeted projection pursuit
- Principal component analysis
- Multilinear PCA

ESDA

- Variogram
- Moran's I
- LISA
- Geit's G
- Geary's C
- Outlier detection
- Trend detection

Modeling

- OLS regression
- Spatial regression
- nonlinear regression
- panel regression
- Spatial filtering
- MGWR/MGTWR

Advanced modeling

- Machine learning
- Cellular automata
- Agent based model

Spatial data visualization

- Static maps
- Dynamic maps

Plans 3 &4: Case and Curriculum Development

3. Case development

- Case studies for selected papers
- Workbook for selected books

4. Curriculum development

- Spatial econometrics and spatiotemporal innovation workshop
- Spatial social science course
- Spatial data analysis course

Data Sources and Code Sources

Data Sources:

- Dataverse
- GitHub
- China Data Online
-

Programs and codes:

- Pysal/GeoDa
- Matlab Spatial econometrics toolbox
- MGWR
- Spatial Econometric Functions in R
- Matlab Spatial filtering

Project Flowchart

Deployment and Sharing

- Dataverse at Harvard
- SDL at Harvard
- SDL at ECUST
- SDL at Wuhan Uni
- SDL at PKU

Sample Works

Spatial Statistics workbench

Sample Work 1: Spatial regression

- ❑ Objective: To identify the factors of spatial difference in neighborhood crime.
- ❑ Data Sources:
 - GeoDa Data and Lab: <https://geodacenter.github.io/data-and-lab/>
 - Dependent variable: CRIME(residential burglaries and vehicle thefts per 1000 households)
 - Independent variable: INC(household income (in \$1,000)), HOVAL(housing value (in \$1,000)), OPEN(open space (area))
- ❑ Spatial Unit: 49 contiguous Planning Neighborhoods in Columbus, OH, 1980

Reference:

Anselin, Luc (2003) "An Introduction to Spatial Regression Analysis in R", <http://labs.bio.unc.edu/Buckley/documents/AnselinIntroSpatRegres.pdf>

Methodology

- Ordinary least squares (OLS):

$$y = X\beta + \varepsilon, \quad \hat{\beta} = \beta + (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \varepsilon$$

- Spatial regression (SLX, SEM, SLM):

- SLX:

$$y = X\beta + WX\theta + \varepsilon$$

- SEM:

$$y = X\beta + (I_n - \lambda W)^{-1} \varepsilon$$

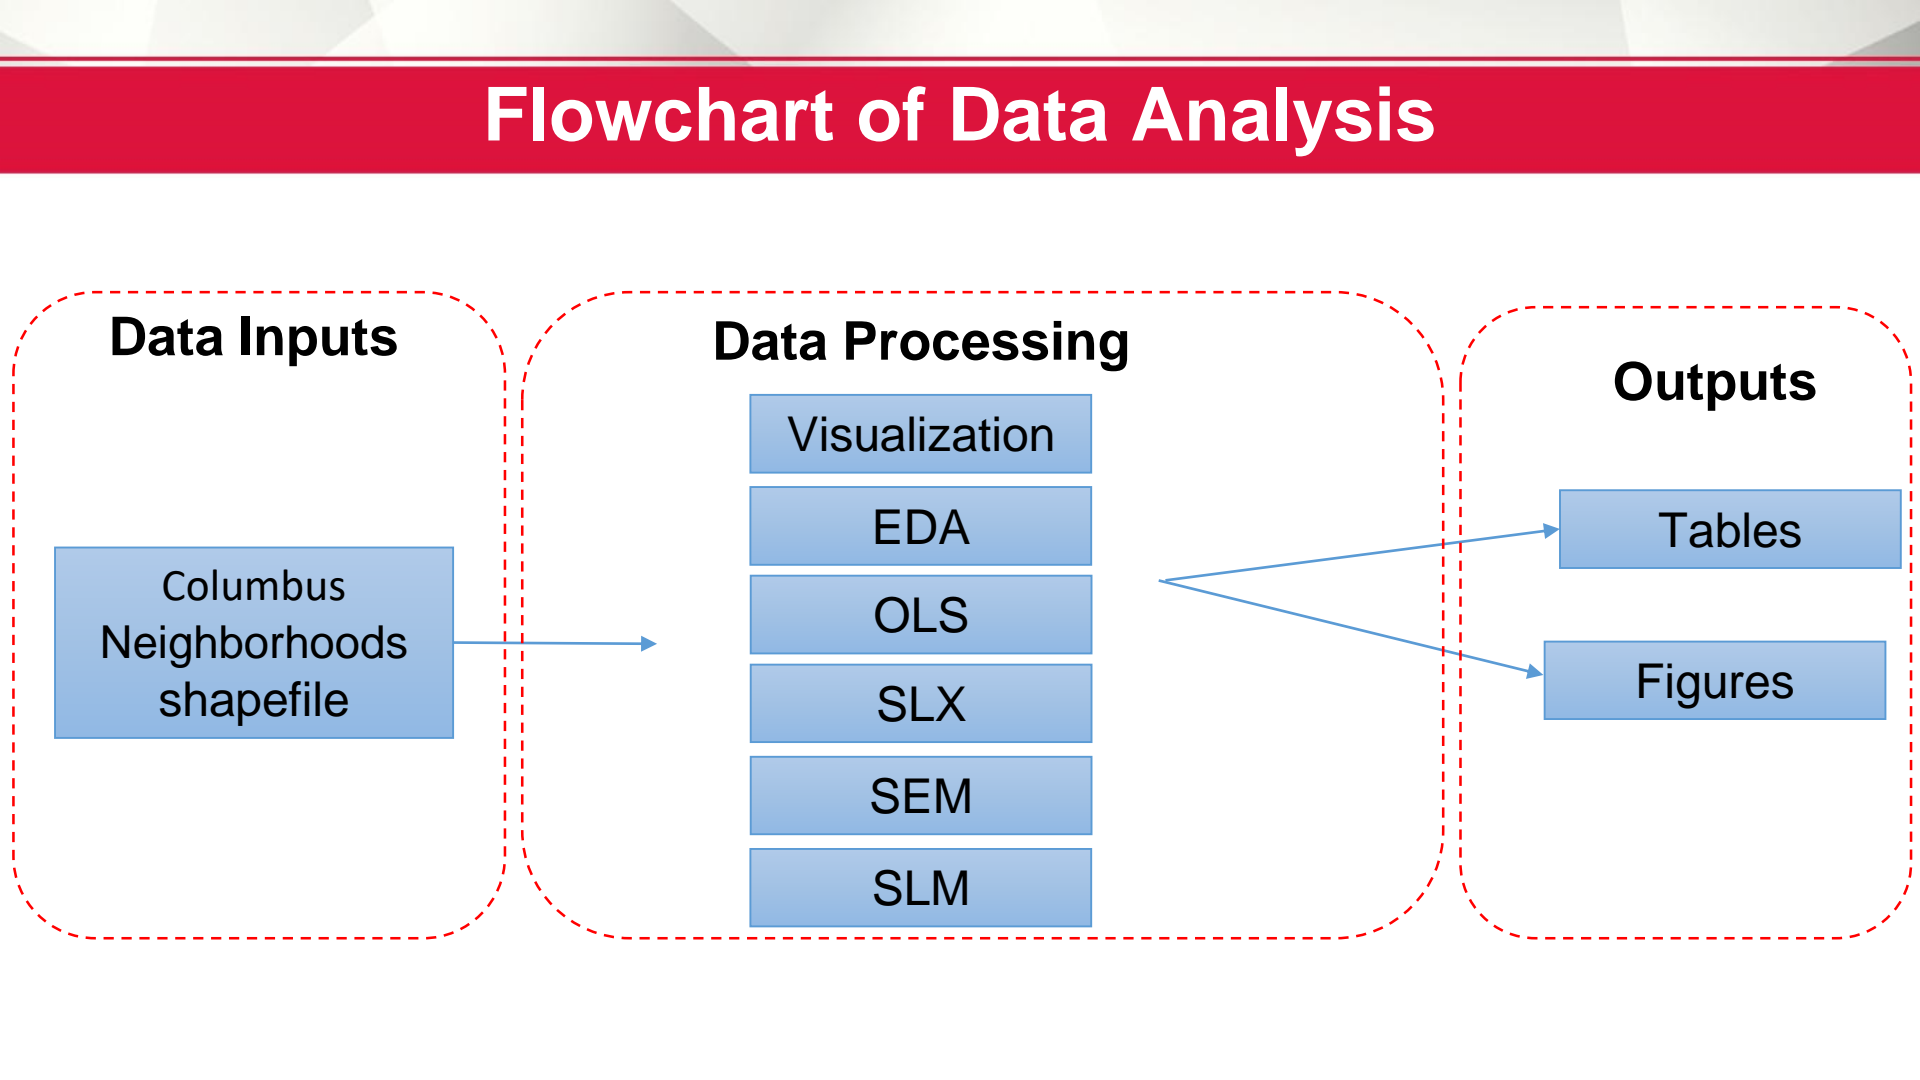

- SLM:

$$y = \rho Wy + X\beta + \varepsilon$$

Flowchart of Data Analysis

Data Inputs

Columbus
Neighborhoods
shapefile

```
graph LR; subgraph Data_Inputs; direction TB; A[Columbus Neighborhoods shapefile]; end; subgraph Data_Processing; direction TB; B[Visualization]; C[EDA]; D[OLS]; E[SLX]; F[SEM]; G[SLM]; end; subgraph Outputs; direction TB; H[Tables]; I[Figures]; end; A --> B; B --> H; B --> I;
```

The flowchart illustrates the data analysis process. It is divided into three main stages: Data Inputs, Data Processing, and Outputs. The Data Inputs stage contains a single box labeled 'Columbus Neighborhoods shapefile'. An arrow points from this box to the Data Processing stage. The Data Processing stage is a vertical stack of six boxes: 'Visualization', 'EDA', 'OLS', 'SLX', 'SEM', and 'SLM'. An arrow points from the 'Visualization' box to the Outputs stage. The Outputs stage is a vertical stack of two boxes: 'Tables' and 'Figures'. Two arrows originate from the right side of the Data Processing stage, one pointing to 'Tables' and the other to 'Figures'.

Workflow Implementation

Required R packages:

- `library("rgdal")`
- `library("maptools")`
- `library("spdep")`
- `library("tripack")`
- `library("RANN")`
- `library("plm")`
- `library("splm")`

Data Input

□ Data Input:

Configure Shapefile Input node: Change the path to where the data file (columbus.shp) is located.

```
1 library("rgdal")
2 library("mapproj")
3 library("spdep")
4 library("tripack")
5 library("RANN")
6 library("plm")
7 library("splm")
8
9
10 f<- CRIME~ HOVAL+INC+OPEN
11 mdata <- readOGR("C:/Users/12074/Desktop/Spatial statistics workbench/columbus/columbus.shp")
12 df<- mdata@data
13 map_crd <- coordinates(mdata)
```

Exploratory Data Analysis

❑ Questions:

- Whether there are correlations between variables?
- If there is any outliers?

Run the EDA node, right click on the node, then click Linear Correlation & Scatter Matrix.

Results from OLS

- ❑ Question: What factors affect the spatial distribution of crime?

Statistics on Linear Regression

Variable	Coeff.	Std. Err.	t-value	P> t
HOVAL	-0.1134	0.2054	-0.5521	0.585
INC	-1.7991	0.4357	-4.1294	0.0003
OPEN	0.2519	0.3798	0.6633	0.5122
Intercept	65.5304	5.4041	12.126	4.30E-13

Multiple R-Squared: 0.5954

Adjusted R-Squared: 0.5549

Diagnostic Tests for Spatial Dependence

□ Questions :

- Whether there is spatial autocorrelation in OLS residuals?
- Which model should be applied: SLM or SEM?

```
Lagrange multiplier diagnostics for spatial dependence

data:
model: lm(formula = f, data = mdata)
weights: w_cn_mat

RLMerr = 0.10028, df = 1, p-value = 0.7515

Lagrange multiplier diagnostics for spatial dependence

data:
model: lm(formula = f, data = mdata)
weights: w_cn_mat

RLMlag = 3.4878, df = 1, p-value = 0.06182

Lagrange multiplier diagnostics for spatial dependence

data:
model: lm(formula = f, data = mdata)
weights: w_cn_mat

SARMA = 8.9576, df = 2, p-value = 0.01135
```

```
Global Moran I for regression residuals

data:
model: lm(formula = f, data = mdata)
weights: w_cn_mat

Moran I statistic standard deviate = 2.8765, p-value = 0.00201
alternative hypothesis: greater
sample estimates:
Observed Moran I      Expectation      Variance
0.227662705          -0.032487594      0.008179232

Lagrange multiplier diagnostics for spatial dependence

data:
model: lm(formula = f, data = mdata)
weights: w_cn_mat

LMerr = 5.4698, df = 1, p-value = 0.01935

Lagrange multiplier diagnostics for spatial dependence

data:
model: lm(formula = f, data = mdata)
weights: w_cn_mat

LMlag = 8.8573, df = 1, p-value = 0.002919

Lagrange multiplier diagnostics for spatial dependence
```

Results from SLM

□ Questions:

- Which factors have significant impact on the spatial distribution of crime?
- If the spatial dependence is significant in the spatial lag model?

```
Call:lagsarlm(formula = f, data = mdata, listw = w_cn_mat)
```

```
Residuals:
```

Min	1Q	Median	3Q	Max
-36.1366	-4.6581	-0.2158	6.9110	23.4083

```
Type: lag
```

```
Coefficients: (asymptotic standard errors)
```

	Estimate	Std. Error	z value	Pr(> z)
(Intercept)	45.796780	7.205228	6.3560	2.07e-10
HOVAL	-0.284854	0.090211	-3.1576	0.0015906
INC	-1.063214	0.304671	-3.4897	0.0004835
OPEN	0.312493	0.311979	1.0016	0.3165136

```
Rho: 0.41935, LR test value: 9.3503, p-value: 0.0022294
```

```
Asymptotic standard error: 0.11922
```

```
z-value: 3.5176, p-value: 0.00043553
```

```
Wald statistic: 12.373, p-value: 0.00043553
```

```
Log likelihood: -182.1766 for lag model
```

```
ML residual variance (sigma squared): 94.999, (sigma: 9.7467)
```

```
Number of observations: 49
```

```
Number of parameters estimated: 6
```

```
AIC: 376.35, (AIC for lm: 383.7)
```

```
LM test for residual autocorrelation
```

```
test value: 0.31597, p-value: 0.57404
```

Summary and Discussion

☐ **Summary:**

- There is significant spatial dependence in the crime distribution over the space.
- OLS model should not be applied directly due to the spatial dependence of the error term.
- Spatial lag model (SLM) is a better choice.

☐ **Discussion on possible expansions:**

- Allow tests of more other variables
- Allow tests of more other models
- Expand to other spatial studies

Instructions for running the workflow

Step 1: Download data files from \Spatial statistics\workbench\01_data\columbus_data\columbus.shp

Step 2: Download workflow from \Spatial statistics workbench\02_workflow\workbench.knwf

Step 3: Open KNIME (version 4.4.1) from local PC

Step 4: Install the following R packages if not yet:

```
"rgdal"      "plm"      "splm"     "spdep"  
"maptools"  "RANN"    "tripack"  
"spdep"     "tripack"
```

Step 5: Import KNIME workflow file (workbench.knwf)

Step 6: Configure “CSV Input” & “Shapefile Input”

Step 7: Click **Run**  button on the top menu

Step 8: Display the outputs (see outputs folder)

Sample Work 2: MGWR

Objectives:

- To identify the impact of location(geography) other than socioeconomic factors on voting.
- To identify the spatial heterogeneity of the impact of socioeconomic factors on voting.

Questions to be answered:

- Is there spatial heterogeneity in the impact of socioeconomic factors on voting?
- Whether location other than socioeconomic factors has any impact on voting?

Data Sources:

- The MIT Election Lab: <https://electionlab.mit.edu/data>
- US Census Bureau: <https://www.census.gov/programs-surveys/acs/technical-documentation/table-and-geography-changes/2016/5-year.html>

Reference:

Stewart Fotheringham, A., Li, Z. and Wolf, L.J., 2021. Scale, Context, and Heterogeneity: A Spatial Analytical Perspective on the 2016 US Presidential Election. *Annals of the American Association of Geographers*, pp.1-20.

Data

- Dependent variable: Votes for the Democratic Party in the 2016 U.S. presidential election

Independent variables:

1. gender ratio
2. percentage of young voters
3. percentage of older voters
4. income disparity
5. percentage employed in manufacturing
6. income
7. black population
8. people with at least a bachelor's degree
9. Hispanic population
10. foreign-born population
11. people with health insurance
12. voter turnout
13. the log of population density
14. votes for a third-party candidate.

Spatial unit: US counties

Methodology

- Spatial data visualization with GIS maps: County-level percentage vote for the Democratic Party, equal interval Graduated color(red to blue).
- Exploratory Data Analysis(EDA): Min, Mean, Median, Max, Std. Dev., Skewness, Kurtosis, Missing, Infinity, Distribution.

- Moran's I:
$$I = \frac{N}{W} \frac{\sum_i \sum_j w_{ij} (x_i - \bar{x})(x_j - \bar{x})}{\sum_i (x_i - \bar{x})^2}$$

- Ordinary least squares (OLS):
$$\mathbf{y} = \mathbf{X}\boldsymbol{\beta} + \boldsymbol{\varepsilon}; \quad \hat{\boldsymbol{\beta}} = \boldsymbol{\beta} + (\mathbf{X}^\top \mathbf{X})^{-1} \mathbf{X}^\top \boldsymbol{\varepsilon}$$

- Multiscale geographically weighted regression (MGWR):

$$y_i^* = \alpha_i + \sum_j \beta_{ij} x_{ij}^* + \varepsilon_i$$

turn_out_beta	117	115	137
pct_FB_beta	1,424	1,350	1,754
pct_isured_b...	43	43	45

The impact of percentage third-party votes

- The impact of percentage third-party votes: Third-party candidates are often varied and have a regional, rather than national, attraction to voters. This is clearly seen in Figure, where across much of the eastern part of the country, and particularly in the Southeast, third-party candidates drew more heavily from Republican voters, increasing the Democratic vote share in a straight fight between Democrats and Republicans. The opposite is true in western states centered on Utah, where the third-party candidate drew more heavily from traditional Democratic voters and therefore increased the share of the Republican votes at the expense of Democratic votes.

Summary and discussion

□ **Summary:**

- There is spatial heterogeneity in the impact of socioeconomic factors on voting. Variables have different effects on voting in different regions.
- Location factor other than socioeconomic factors are important for voting.

□ **Discussion on further questions and expansions:**

- Tests on possible spatial autocorrelation in the results from MGWR models
- Explore potential impacts of geographical context
- Apply non-linear MGWR models

Instructions for running the workflow

Step 1: Download data files from \Spatial statistics workbench\01_data\election_data\election.csv, US_counites.shp

Step 2: Download workflow from \Spatial statistics workbench\02_workflow\MGWR.knwf

Step 3: Open KNIME (version 4.4.1) from local PC

Step 4: Install the following python packages if not yet:

- libpysal 4.4.0
- esda 2.3.6
- seaborn 0.11.2
- mgwr 2.1.2
- pandas 1.1.3
- matplotlib 3.2.2
- geopandas 0.9.0
- descartes 1.1.0
- pysal 1.14.4

Step 5: Import KNIME workflow file (MGWR.knwf)

Step 6: Configure “CSV Input” & “Shapefile Input”

Step 7: Click Run  button on the top menu

Step 8: Display the outputs (see outputs folder)

List of Documents for the Sample Work

Documents	Description	Files
Knime workflows	1 workflow file	MGWR.knwf
Presentation	1 PPTX	MGWR.pptx
Data	1 data table in CSV	election.csv
	1 map in Shapefile	US_counties.shp
Output files	24 Output files	statistics.csv, accuracy.csv, bandwidth intervals.csv mgwr_summary.txt distribution.png, Moran's I.png, x1.png-x14.png, Contribution due to xs.png, Intercept.png, MGWR predictions.png, MGWR residuals.png

How to Join the Project?

- **Requirements:**
 - Self-motivation on spatial data science and spatial social sciences
 - Commitment of 3-6 hours per week on the project
 - Participation in regular online meetings on the project
 - Timing reports on the project by following the schedule
- **Tasks:**
 - Reading the references for the project
 - Identifying methodology for spatial data analysis
 - Preparing the data for case studies
 - Testing (or developing) nodes for the workbench
 - Writing the user guide
 - Drafting the PPT for project presentation
- **To Apply:**
 - Send a copy of CV with photo to spatialdatalab@lists.fas.harvard.edu
 - Join an online interview

What You Can Benefit From the Project?

- **Improvement:**
 - Advanced methodology
 - Cutting-edge Technology
 - Frontier applications
 - Enhanced visibility
- **Recognition:**
 - Certificate of completion
 - Project team member on the Lab website (<http://spatialdatalab.org>)
 - Academic recognition
 - Public recognition
- **Capacity:**
 - Infrastructure support
 - Networking support
 - Leadership support
